Retrospective Notes

Doge Driven Development

From our retrospective, we found a couple of general trends:
- Our tools, Eclipse and Github, are the primary source of frustrations and confusion to our team.
- As a team, we agree that we all like our current schedule of meeting twice a week.

1. Remove project.properties file from repo and put it in the .gitIgnore file (1 Point)

Done.

2. Make Github functional for everyone

Due to the GUI GitHub application not working on one of our machines, that machine has switched to using the PowerShell command line in order to access git. The workaround is functional and is less trouble to the team than debugging the GUI repeatedly.

3. Make Eclipse functional for everyone.

Since the documentation, diagramming, and process team did not need to contribute considerable code during this iteration, we decided to focus team efforts on other things. Eclipse has not stopped working for the development team, and so everyone who has needed Eclipse has had it.
